

# Vehicular Emission Monitoring using an Internet-of-Things System

Jitesh Aggarwal, Bharat Vaidhyanathan

Project Advisor: Dr. Debopam Acharya

Department of Computer Science and Engineering

## SHIV NADAR UNIVERSITY

### Abstract

A major source of air pollution in a bustling metropolis is vehicular emission. To address this problem of increasing air pollution due to vehicular emission, cities have applied several parameters like the Odd-Even" rule for driving vehicles.

In this work, we develop AirCheQ, an Internet of Things (IOT) system that measures several gases that originate from vehicular emission. The setup is built using the Raspberry Pi platform and connecting several gas sensors and other environmental monitoring devices that senses gases and other environmental conditions, and wirelessly sends it to a server for visualization and analysis. The system is location aware, and shows real time vehicular emission information on a Google Map Interface.

### Introduction

- Air pollution in metropolitan cities is rising at an alarming rate. To tackle this issue, first step is to make people aware of the problem.
- Using the Internet-of-Things system with participatory sensing, the project collects several environmental data from a large subset of the pollutants in vehicular emission
- AirCheQ aggregates the crowd sourced data and exhibits it in a visually appealing and meaningful manner.

Software Requirements	Hardware Requirements
Java SE (Oracle JDK 8)	Core Setup Requirements – Raspberry Pi 2 Mod B
Java EE (Oracle JDK 8)	Sensing Requirements (Sensors)
Python (v2.7)	Belkin USB Bluetooth Adapter
Meteor (Full Stack of Blaze and MongoDB)	Nolan GPS Receiver
Android Studio (v1.5.1)	Tenda USB WiFi Module
Raspbian OS (Jessie)	Server Machine / Cloud
	Power Bank, ADC, Android Smartphone

Figure 1: Table depicting the Software and Hardware requirements of the project

Environmental Parameter Sensed	Sensor(s) used to detect
Carbon Dioxide	MQ135
Smoke	MQ2
Methane	MQ4
LPG	MQ6
Carbon Monoxide	MQ7, MQ9
Humidity	DHT22
Temperature	DHT22

Figure 2: Table depicting the sensor used for each of the environmental parameters

### Problem Description

- This project is designed to serve as a prototype for a crowd sourced external environment monitoring system
- The project involves using a Raspberry Pi 2 Mod B equipped with multiple MQ-X sensors coupled with DHT22 sensor which work as the input source to sense various gases, temperature and humidity levels.
- A Bluetooth enabled GPS receiver connected to the Raspberry Pi acts as a neighbourhood sensor and serves as a reliable source of geolocation for the setup.

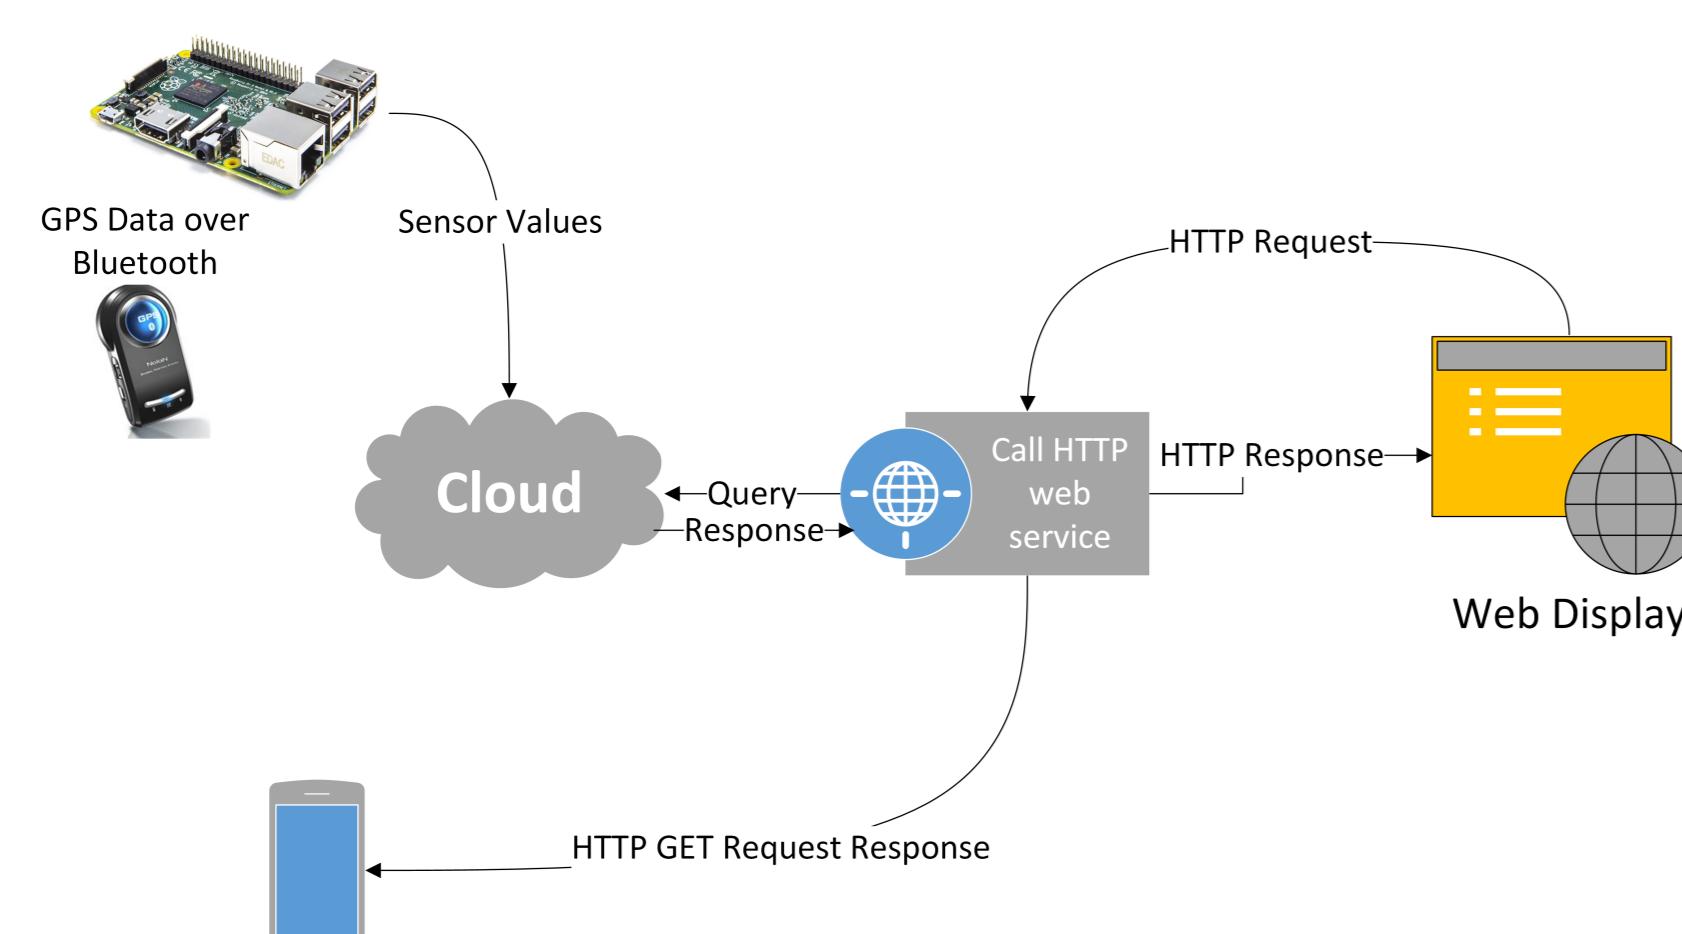

Figure 3: A high-level diagram explaining the entire IoT setup for AirCheQ

### Project System Setup

The AirCheQ Project is majorly made up of two components: The Hardware System Setup and Software System Setup. Although the Software System consists of a Web System Setup and an Android Application.

### Hardware System Setup

- A fully functional Raspberry Pi 2 Mod B installed with Raspbian Jessie OS.
- While the digital DHT22 sensor can be directly read, analog gas sensors need to be interfaced to an ADC MCP3008 and calibrated in order to sense the desired gases.

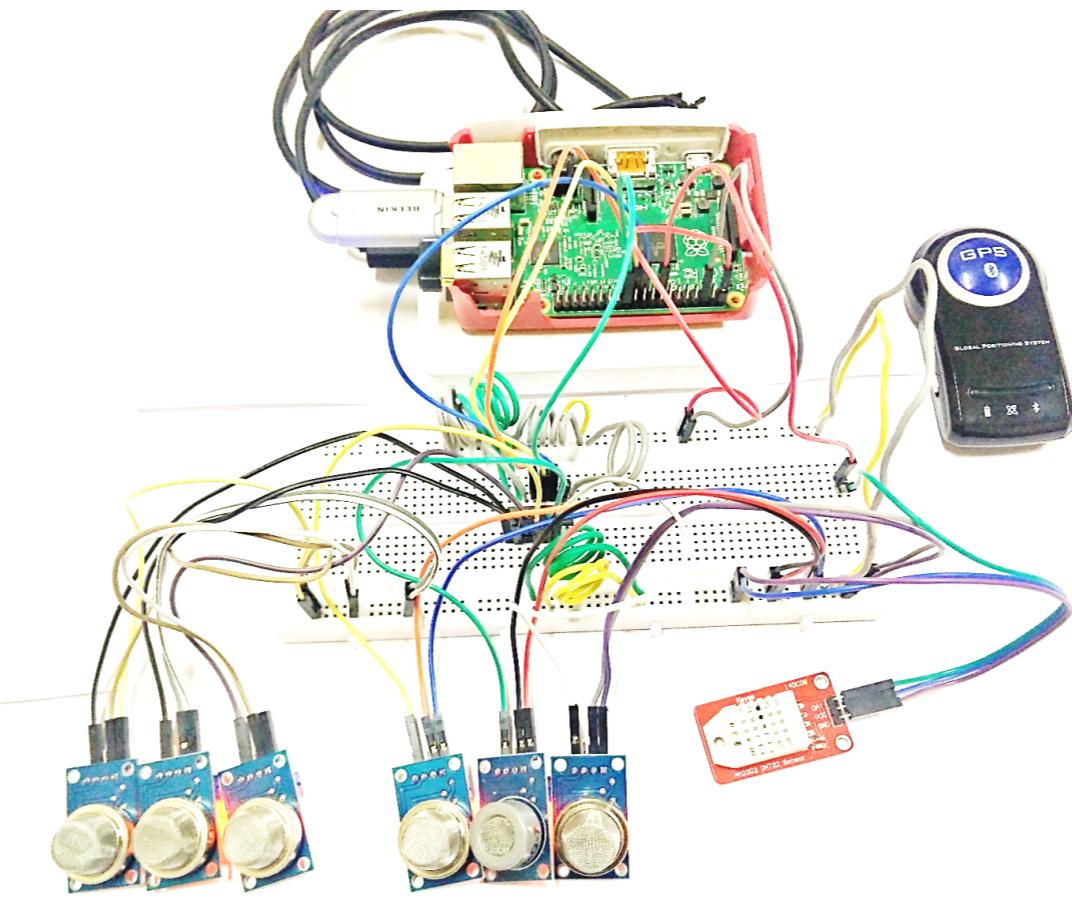

Figure 4: The prototype hardware setup with 6 MQ-x sensors and DHT22 sensor interfaced to the Raspberry Pi 2 Mod B along with the Bluetooth GPS receiver and Belkin USB BT adapter

- The Bluetooth GPS receiver requires a Bluetooth USB adapter to connect to the Raspberry Pi. The NMEA sentences sent by the GPS receiver are used to deduce the latitude and longitude.

### Software System Setup

- The software system setup of AirCheQ has 3 major components: Meteor Server, Java web service and the Android Application.

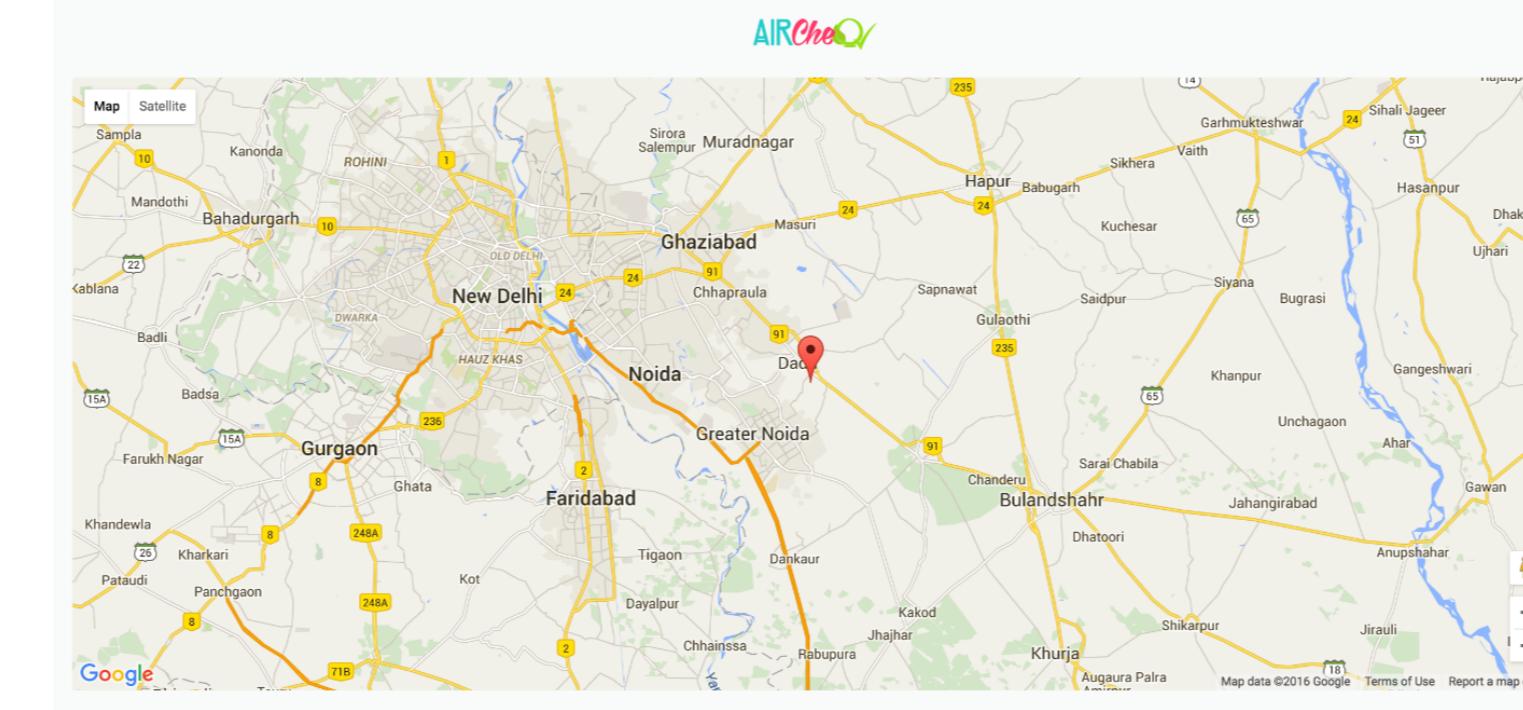

Figure 6: The homepage of the website opens up with markers from where the data is collected

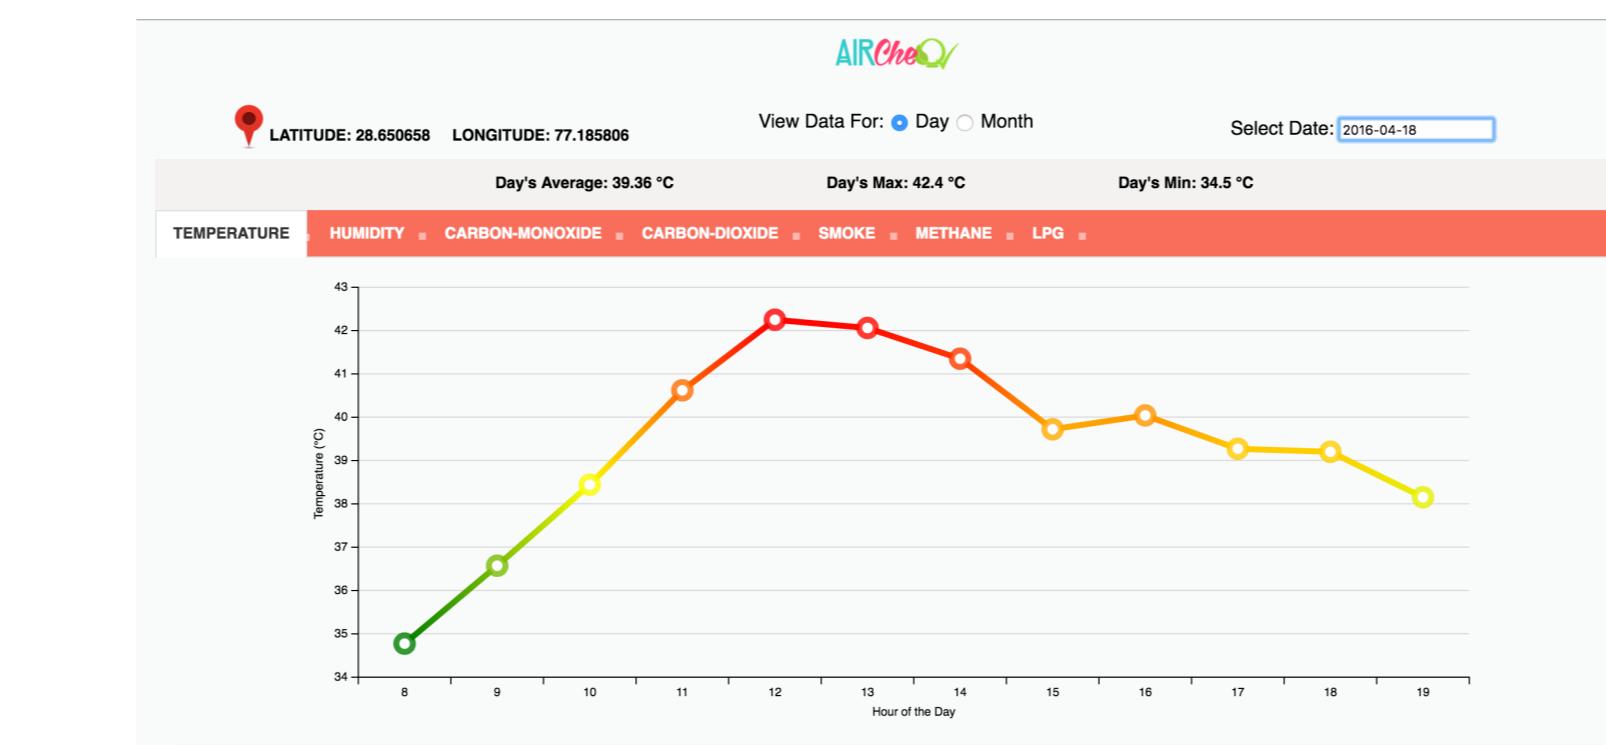

Figure 7: Temperature Data collected in Delhi on 18 April 2016

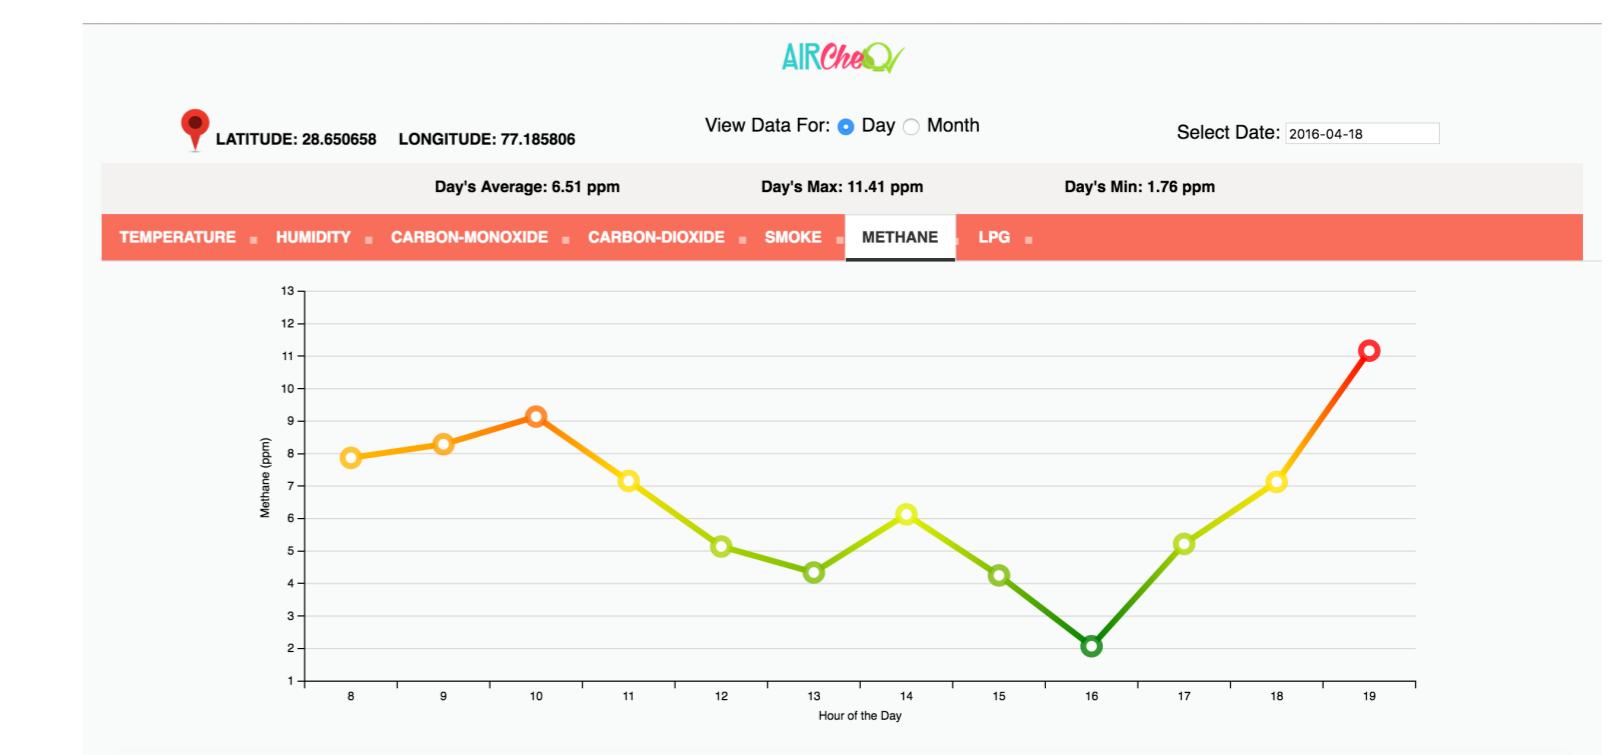

Figure 8: Methane Data collected in Delhi on 18 April 2016

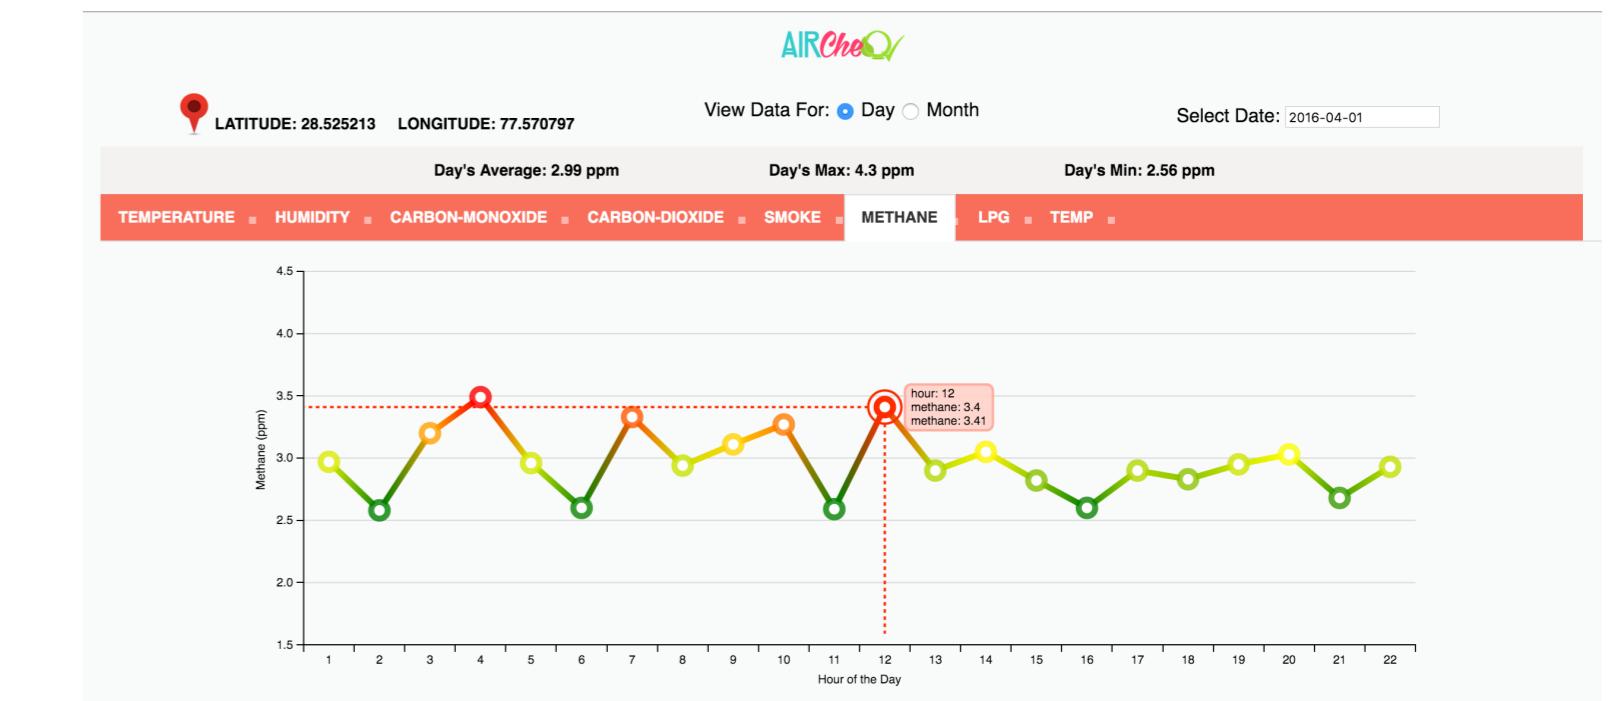

Figure 9: Hovering over a data point of Carbon Monoxide draws its x and y intercepts

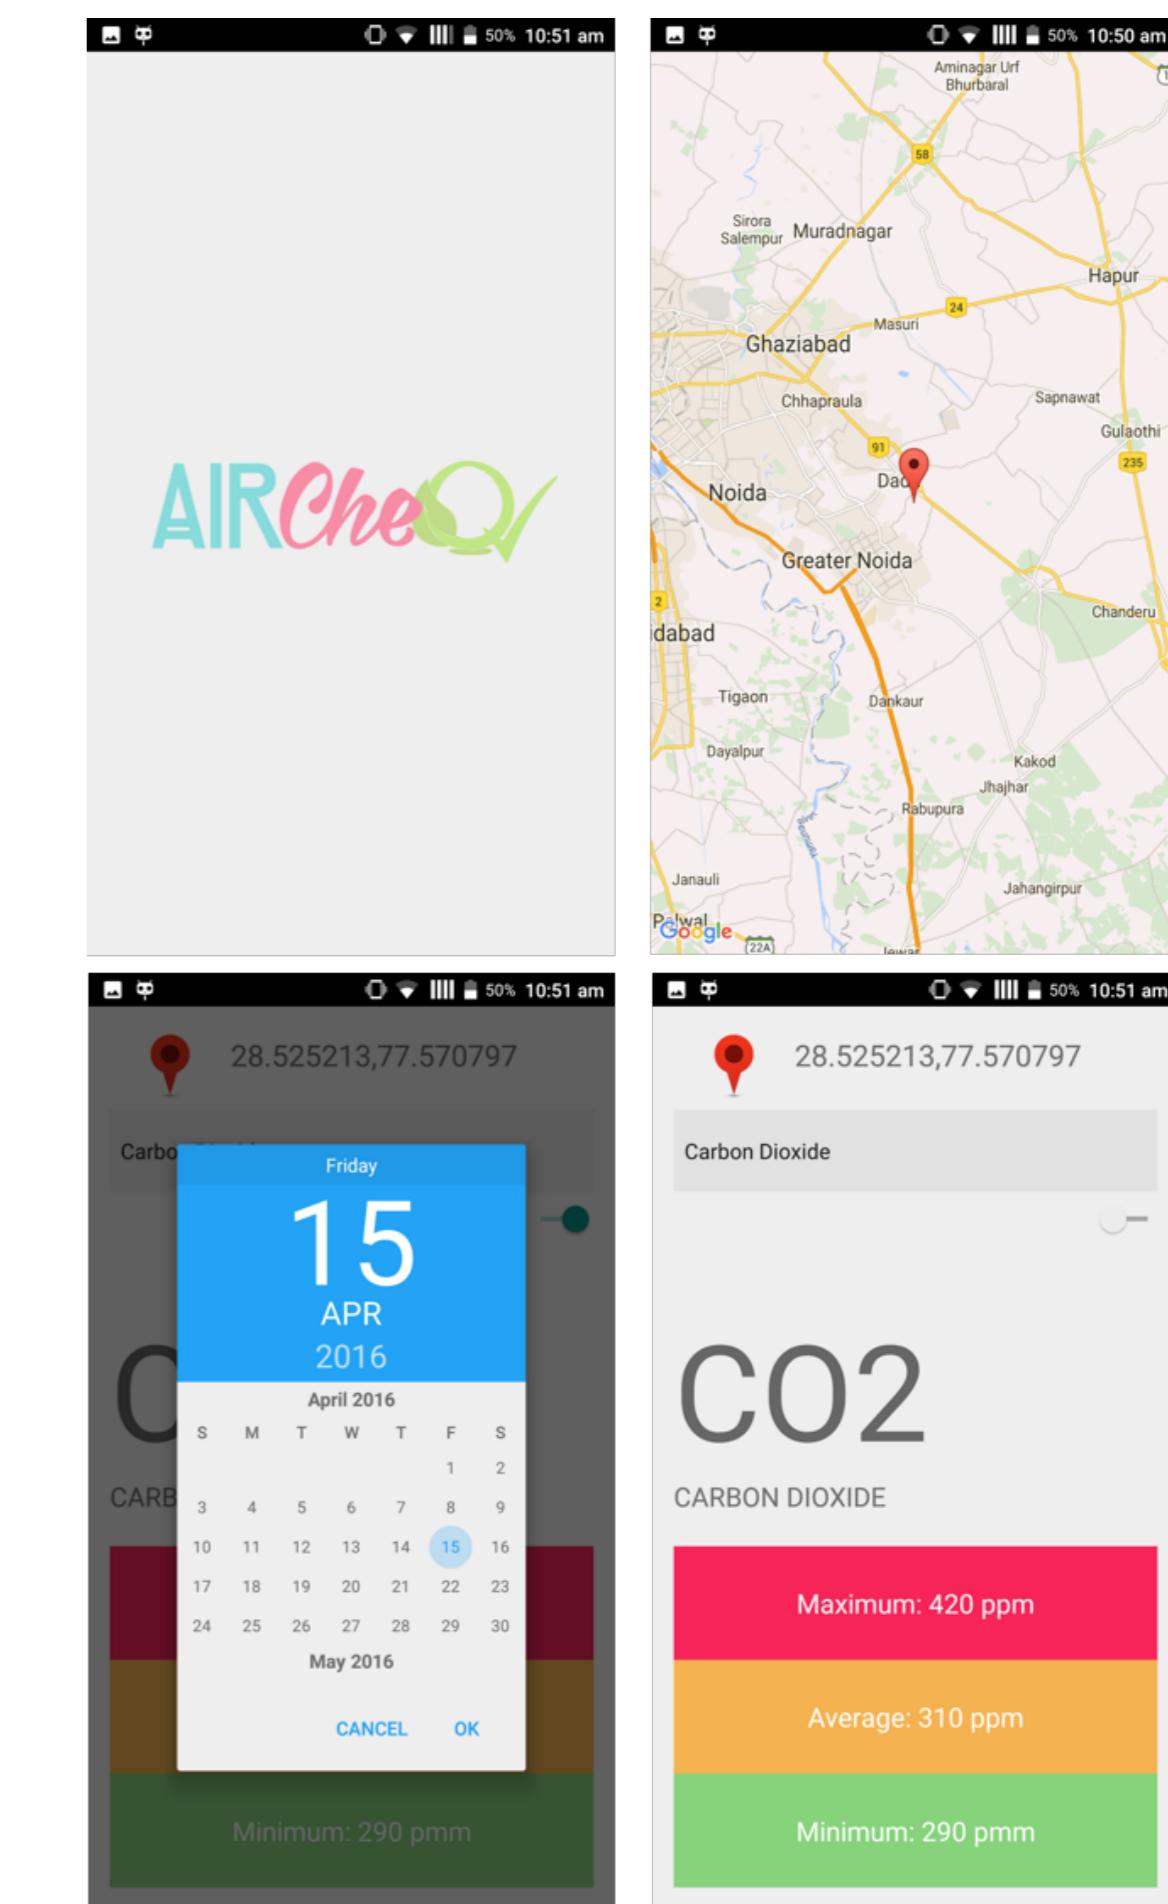

Figure 10: Screenshots of the AircheQ Mobile App

- The Web Service acts as an interface between the UI and the Database. Both Web App and Android App load up with Google Maps populated with location markers. Clicking these markers redirects the users to Graph View in the Web App and a Quick PPM View in the Mobile App.
- The developed Web Application is reactive and shows real time data by syncing with the DB automatically.

### Conclusion

- A fully functional IoT participatory data collection system was developed. Successful sensing of various vehicular emission components like carbon dioxide, carbon monoxide, LPG, methane, smoke was achieved. Use of incentive schemes, be it monetary or non-monetary, could be a possible solution to increase the number of users.

### Acknowledgement

We would like to express our sincere gratitude towards our project advisor Dr. Debopam Acharya for his constant support and inputs. He continually guided us through various phases of this project since its inception.
